

Advanced training workshop

Biorisk assessment methodologies and models

Gent, 15 September 2009

How to perform biorisk assessments in a repeatable and quantifiable way?

This workshop will address this by including presentations and discussions on methodologies and models which have been developed over the last few years. The differences between actual risk and concern (or perception) will also be addressed. Workshop attendees will review and work through a simplified and a detailed version of a newly developed biorisk assessment model. The aim is to provide both a learning and a feedback exercise for participants and trainers.

Program
